## AMCS 390 Fall 2017 Homework 5

Come prepared to present your solutions on Thursday, November 16th.

1. Consider the two-point BVP

$$\epsilon u'' = au' + b(t)u + q(t)$$

$$u(0) = b_1$$

$$u(1) = b_2,$$

where  $a \neq 0$  is a constant and b, q are continuous functions, all  $\mathcal{O}(1)$ .

- (a) Write the ODE in first-order form for the vairables  $y_1 = u$  and  $y_2 = \epsilon u' au$ .
- (b) Letting  $\epsilon \to 0$ , show that the limit system is an index-1 DAE.
- (c) Show that only one of the boundary conditions is needed to determine the solution of the DAE. Which one? Why?
- 2. Consider the DAE

$$y_1' = y_3 y_2' - y_2 y_3'$$

$$0 = y_2$$

$$0 = y_3$$
.

- (a) Show that the DAE has index 1.
- (b) Show that if we add to the right-hand side the (small) perturbation

$$\delta(t) = (0, \epsilon \sin(\omega t), \epsilon \cos(\omega t))^T$$

then in the perturbed solution  $y_1 = \epsilon^2 \omega$ , which is unbounded as  $\omega \to \infty$ . DAEs are unstable in the sense that small perturbations to the algebraic equations can induce large perturbations in the solution.
